

ಬಿ.ಎಂ.ಎಸ್. ತಾಂತ್ರಿಕ ಮತ್ತು ವ್ಯವಸ್ಥಾಪನಾ ಮಹಾವಿದ್ಯಾಲಯ

(ವಿ.ಟಿ.ಯು. ಅಡಿಯಲ್ಲಿನ ಸ್ವಾಯತ್ತ ಸಂಸ್ಥೆ)

BMS INSTITUTE OF TECHNOLOGY AND MANAGEMENT
(Autonomous Under VTU)

Department of Master of Computer Applications

(Accredited by NBA, New Delhi)

Alternate Assessment Tool (AAT) # 1

USN	1BY23MC019	Student Name	Bhavana K
Course Code	22MCA301	Course Title	Machine Learning
Semester	III	Academic Year	2024-25
Date of Submission	15-02-2025	Number of Pages Submitted	8

AAT Question or Topic or Problem Statement

Computer Price Estimation

Whenever one thinks of buying a new computer, the first thing that comes to mind is to curate a list of hardware specifications that best suits their needs. The next step is browsing different websites and looking for the cheapest option available. Performing all these processes can be time-consuming and require a lot of effort. But machine learning can help us build a system that can estimate the price of a computer system by taking into account its various features.

Download the Basic Computer Data dataset from Kaggle.

1. Analyze distributions of numerical features like `cpu_usage`, `memory_usage`, and `disk_usage`.
2. Explore categorical variables (`os_version`, `processor_type`) using bar charts.
3. Detect potential anomalies: Scatter plots of `cpu_usage` vs. `memory_usage` for abnormal trends.
4. Handle missing values: Impute missing numerical values (e.g., `network_speed`) with the median and Impute categorical values (e.g., `os_version`) with the mode.
5. Encode categorical variables
6. Create derived features: $\text{efficiency_ratio} = \text{cpu_usage} / \text{memory_usage}$ and $\text{storage_utilization} = \text{disk_usage} / \text{storage_size}$.
7. Develop a price estimation model that can analyze historical data and identify patterns and trends in the relationship between computer specifications and prices.
8. Train a machine learning model on this data, so that the model can learn to make accurate predictions of prices for new or unseen computer components.
9. Apply Machine learning algorithms such as K-Nearest Neighbours / Decision Trees / Random Forests etc., to effectively capture complex relationships between features and prices, leading to more accurate price estimates.
